WPRS™
Whole Person Risk Score

See the High-Cost Claim Before It Happens.

Whole Person Risk Score™ (WPRS™) is a predictive risk intelligence engine that identifies who is at risk and why, early enough to change the outcome.

WPRS™ Whole Person Risk Score

CLINICAL DEPTH

WPRS combines diagnoses, medications, care quality gaps, social determinants, and more into a predictive score. No single factor tells the full story.

MODIFIABLE RISK

The model's FLARE component identifies engagement and behavior factors that can be changed. That focus on modifiable risk is what makes intervention possible.

INDIVIDUAL PREDICTION

Every score is built for a specific person, not a demographic segment. *Sam* and *Sarah* each get their own risk profile, so outreach is precise and timely.

WPRS identifies individuals for targeted intervention before they reach crisis. This intelligence drives high-value visits, care pathway interventions, and targeted activation. Risk migration across tiers is tracked over time, so program performance is measurable and defensible.

The best way to address high-cost claimants is to not have high-cost claimants.

CONVERGING HEALTH RESULTS:

$18M in savings over 15 months at a safety-net hospital serving a high-risk Medicaid population

$4,847 PMPY lower healthcare costs for members engaged with a PHA vs. those not engaged at a global retail chain

$16.1M annualized savings through identification and activation of high-risk members at a major urban transit authority
